

Approving a payment at mvxsafe.io

A guide for board members of the Foxsy AI Foundation safes

The Foundation's tokens sit in safes that **no single person can move**. Each safe needs **two signatures out of three**. Somebody proposes a payment, you look at it, and if you agree you sign. Nothing happens until two of you do.

Your part takes about a minute, and it is the same every time.

1 Open the safe and connect your wallet

Go to **mvxsafe.io**, open the safe named in the email, and press **Connect**.

- Choose how you sign: **xPortal** (scan the code with your phone), the **DeFi Wallet** browser extension, a **Ledger**, or the **web wallet**.
- Connecting only proves who you are, it cannot move anything.

2 Read what you are approving

The pending action is written in plain words, for example: *Send 1,000,000 FOXSY to erd1abc...xyz*.

- Check the **amount**, the **token** and the **address** against what you were told.
- If anything is different, **do not sign**. Close the page and call Sebastian.

3 Sign

Press **Sign**, confirm in your wallet, and you are done.

- Your signature is one of the two the safe needs.
- It costs a tiny network fee, so keep a little EGLD in your wallet, around 0.05 is plenty.

4 Optional: carry it out

If your signature is the one that completes the two, a **Perform** button appears. Pressing it is what actually sends the tokens.

- You do not have to. **Any board member can press it later**, and the result is identical.
- If you prefer to stop after signing, simply close the page and tell Sebastian.

Three things that are always true. Your keys never leave your wallet, and mvxsafe.io never sees them. Signing approves one specific action, nothing else, and it can be undone while the action is still waiting. Everything is recorded publicly on the MultiversX blockchain, so any signature can be checked afterwards.

Questions, or something that does not look right: contact Sebastian Marian, sebastian.marian@foxsy.ai. The interface is open source at github.com/foxsyai/mvxsafe.
